

## Supplemental material

**Fig.S1.** Basophil activation test flow cytometry plots

A) BAT plots in the patient with the positive control N-formylmethionine-leucyl-phenylalanine (fMLP). Basophil were selected as CD203c+ cells. This test is considered positive if basophil degranulation is >5%. B) BAT plots for rocuronium, sugammadex and rocuronium-sugammadex

mixture (SR-M) complex. This data shows no basophil response for rocuronium nor sugammadex exposure, but reflects a positive result to the SR-M complex.
