

## SUPPLEMENTARY MATERIAL

**Supplementary Figure.** Flowchart of patients included in the study. <sup>1</sup>Six of these patients had also received antibiotics from different groups (clindamycin in two cases, and moxifloxacin, azithromycin, clarithromycin, and erythromycin in one case each). <sup>2</sup>The patient who developed skin rash in this group had received cotrimoxazole. <sup>3</sup>In the following years, 9 patients tolerated the same beta-lactam involved in the reaction (amoxicillin), 2 patients with phenoxymethylpenicillin as culprit antibiotic tolerated amoxicillin, and 1 patient with amoxicillin as culprit tolerated cloxacillin. In addition, four patients later tolerated cephalosporins which were not related to the culprit drug.
